Reference Letter

Esteemed Academic New Star Jury of Tsinghua University,

I am pleased to write this letter in support of Mr. Yizheng Wang. Mr. Yizheng
computational mechanics group at the Institute of Structural Mechanics, Bauhaus Univ
as a visiting PhD-student early 2024 for a 1 year visit and also in January 2026. I m
several times in China where we started before our collaboration. Due to my close ass
for the past years, I know him very well both technically and personally. Mr. Wang's
doctoral studies will be on AI for partial differential equations (AI4PDEs) with applicati
problems in engineering.

Bauhaus-Universität Weimar

Mr. Yizheng Wang has an outstanding knowledge of continuum mechanics, modern n
machine learning approaches and their applications. He has the capability to implement new ideas extremely quickly and to prepare manuscripts on his work in a short time. His implementation skills are extraordinary and he knows many coding languages. Mr. Wang has developed several new computational methods like physics informed Kolmogorov Arnold Network, the (Complementary) Deep Energy Method based on different network architectures including techniques for operator learning and thoroughly verified and validated their capabilities.

He recently developed physics informed (or more precisely variational physics informed) neural operators which entirely avoid labeled data which dramatically improve the efficiency of current simulation workflows. To my best knowledge, he is the first to successfully develop those operators for varying geometries, boundary conditions and input parameters which is not only of tremendous academic but also industrial importance. He furthermore suggested the use of highly efficient initialization approaches for traditional solvers with further speed ups to a factor of 10 for specific problems.

Mr. Yizheng Wang is a very diligent and hard working student and his motivation is exceptional. He has implemented most of his methods from scratch. We have published jointly 10 manuscript in reputable journals and currently several manuscripts are in review. Mr. Wang is an exceptionally productive researcher and his academic capabilities are comparable already to assistant professor level.

Out of the 40 PhD students I graduated so far and the additional 120 PhD students and postdocs who visited my research lab over the past 20 years, Mr. Yizheng Wang clearly sticks out due to his outstanding

April 4, 2026

technical and academic skills.

Mr. Wang is very organized and has very good administrative and organizational capabilities. He quickly adjusted to the new environment in Weimar and is well integrated in my team where he already has proven some leadership qualities helping and advising other PhD students in my group. He can quickly adopt to coordinate and work with several people in parallel. He is a congenial and very friendly coworker and has excellent relations with his colleagues. His commitment and the punctuality towards deadlines are commendable.

He has my strongest support and I am sure that he will make excellent contributions in the future.

Best regards,

Timon Rabczuk
Chair of Computational Mechanics
